

Urban Sustainability for Human Development

An aerial photograph showing a vast, dense urban area. In the center, there is a cluster of taller buildings, possibly a city center or a planned urban area. The surrounding area is filled with a dense, low-rise urban fabric, likely informal settlements or a sprawling city. The terrain appears to be hilly or uneven, with the urban development following the contours of the land. The overall image has a grainy, high-contrast appearance, typical of older satellite or aerial photography.

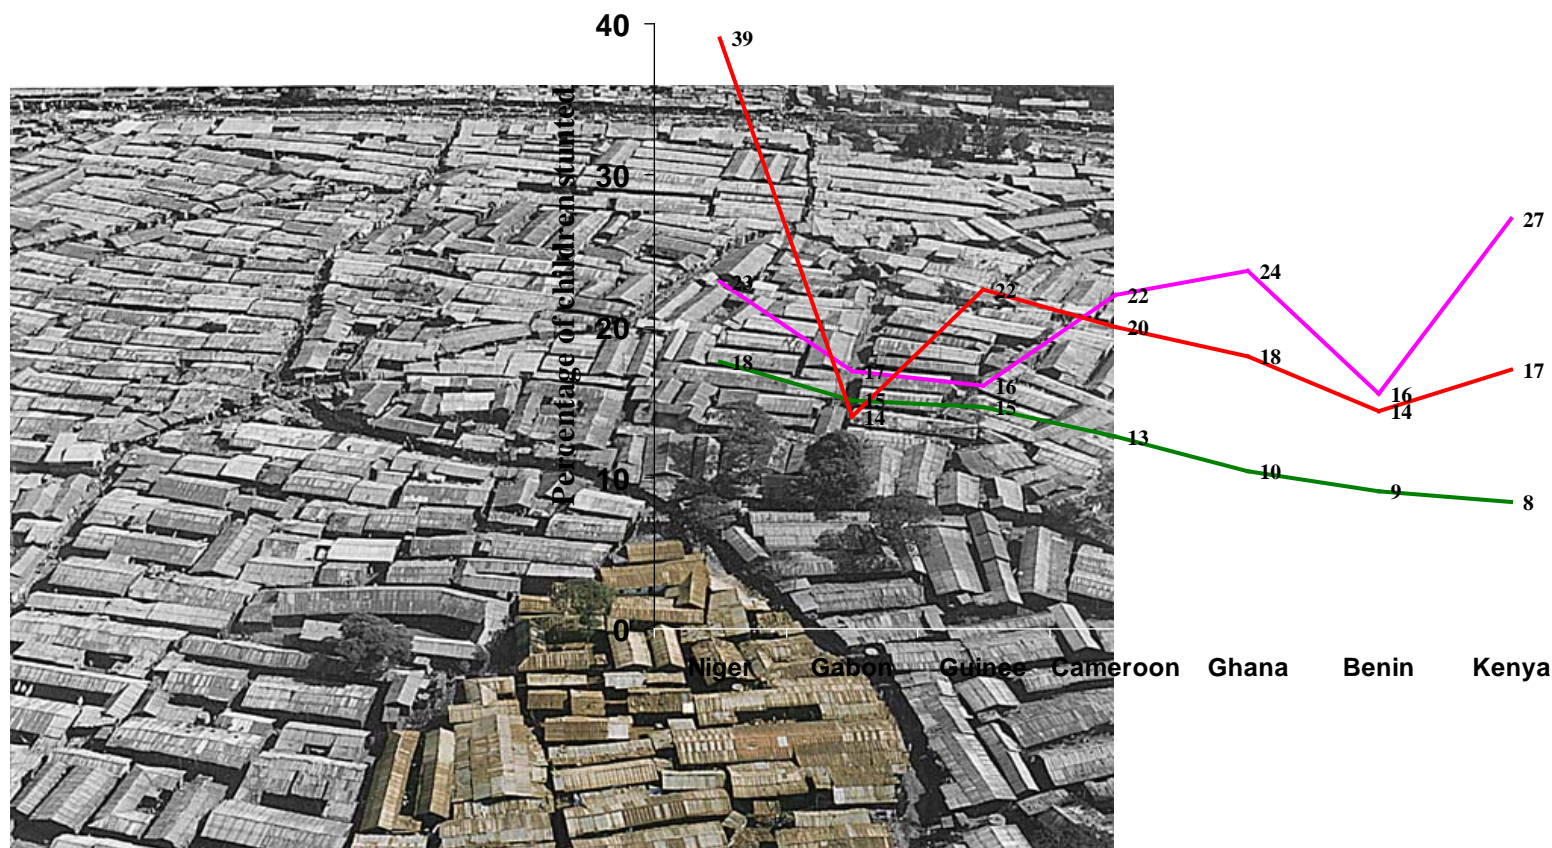

What key trends are currently monitored at the international, National and subnational levels?

Director Research and Capacity Development

State of Affairs in Monitoring Urban Sustainability

**Indicators, Geospatial Technology & Disaggregation for SDG11
and its Linkages with other SDGs**

Some Preliminary Remarks...

Conventional urban studies dominated by demographic & statistics without clear space analysis

Some Preliminary Remarks...

NYU Stern

- Great technological advances in space related information is increasingly available
- Still, poor operational connection to the urbanization process:

Which cities grow faster, why?

UIP 2010 ... 80% of cities lack spatial monitoring systems

- Spatial information & policies are poorly connected
- Sub-city level information more available, but not integrated to decision-making

**The depiction of the city -potential and problems-
using spatial analysis still progressing**

Various Institutions are increasingly integrating the spatial dimension.... to

- Monitor global/regional trends
- Identify distressed areas and inequality
- Assess housing & basic service delivery
- Support urban planning practices
- Identify environmental problems/solutions
- Identify economic potentials in cities
- Assess policy implementation/community-led accountability
- Monitor impact of implemented policies
- Identify potentials for climate change mitigation

Geo-information, policies and monitoring

Monitoring Urban Sustainability -Use of Spatial Indicators - examples:

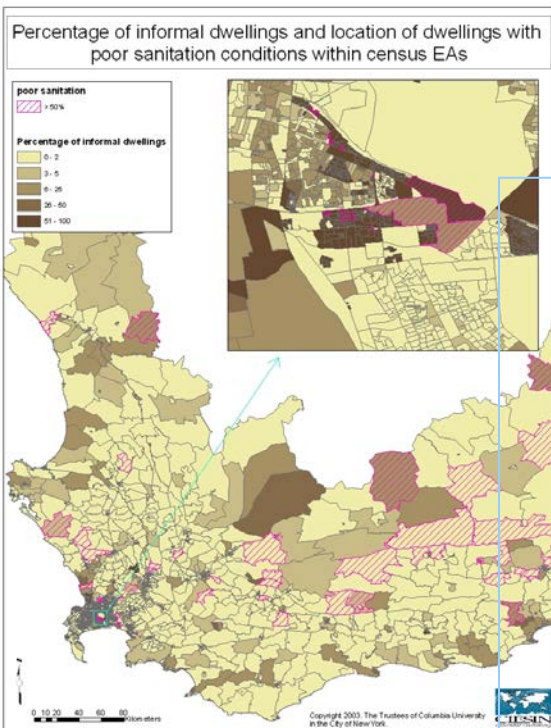

Community-led
data
collection

National
Governments
(NSO)

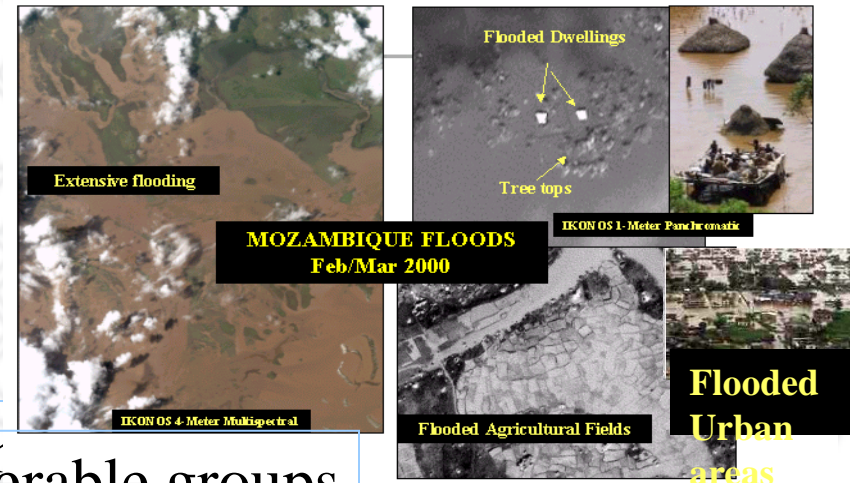

Monitoring Urban Sustainability - Use of Spatial Indicators -

Integrate small area estimates

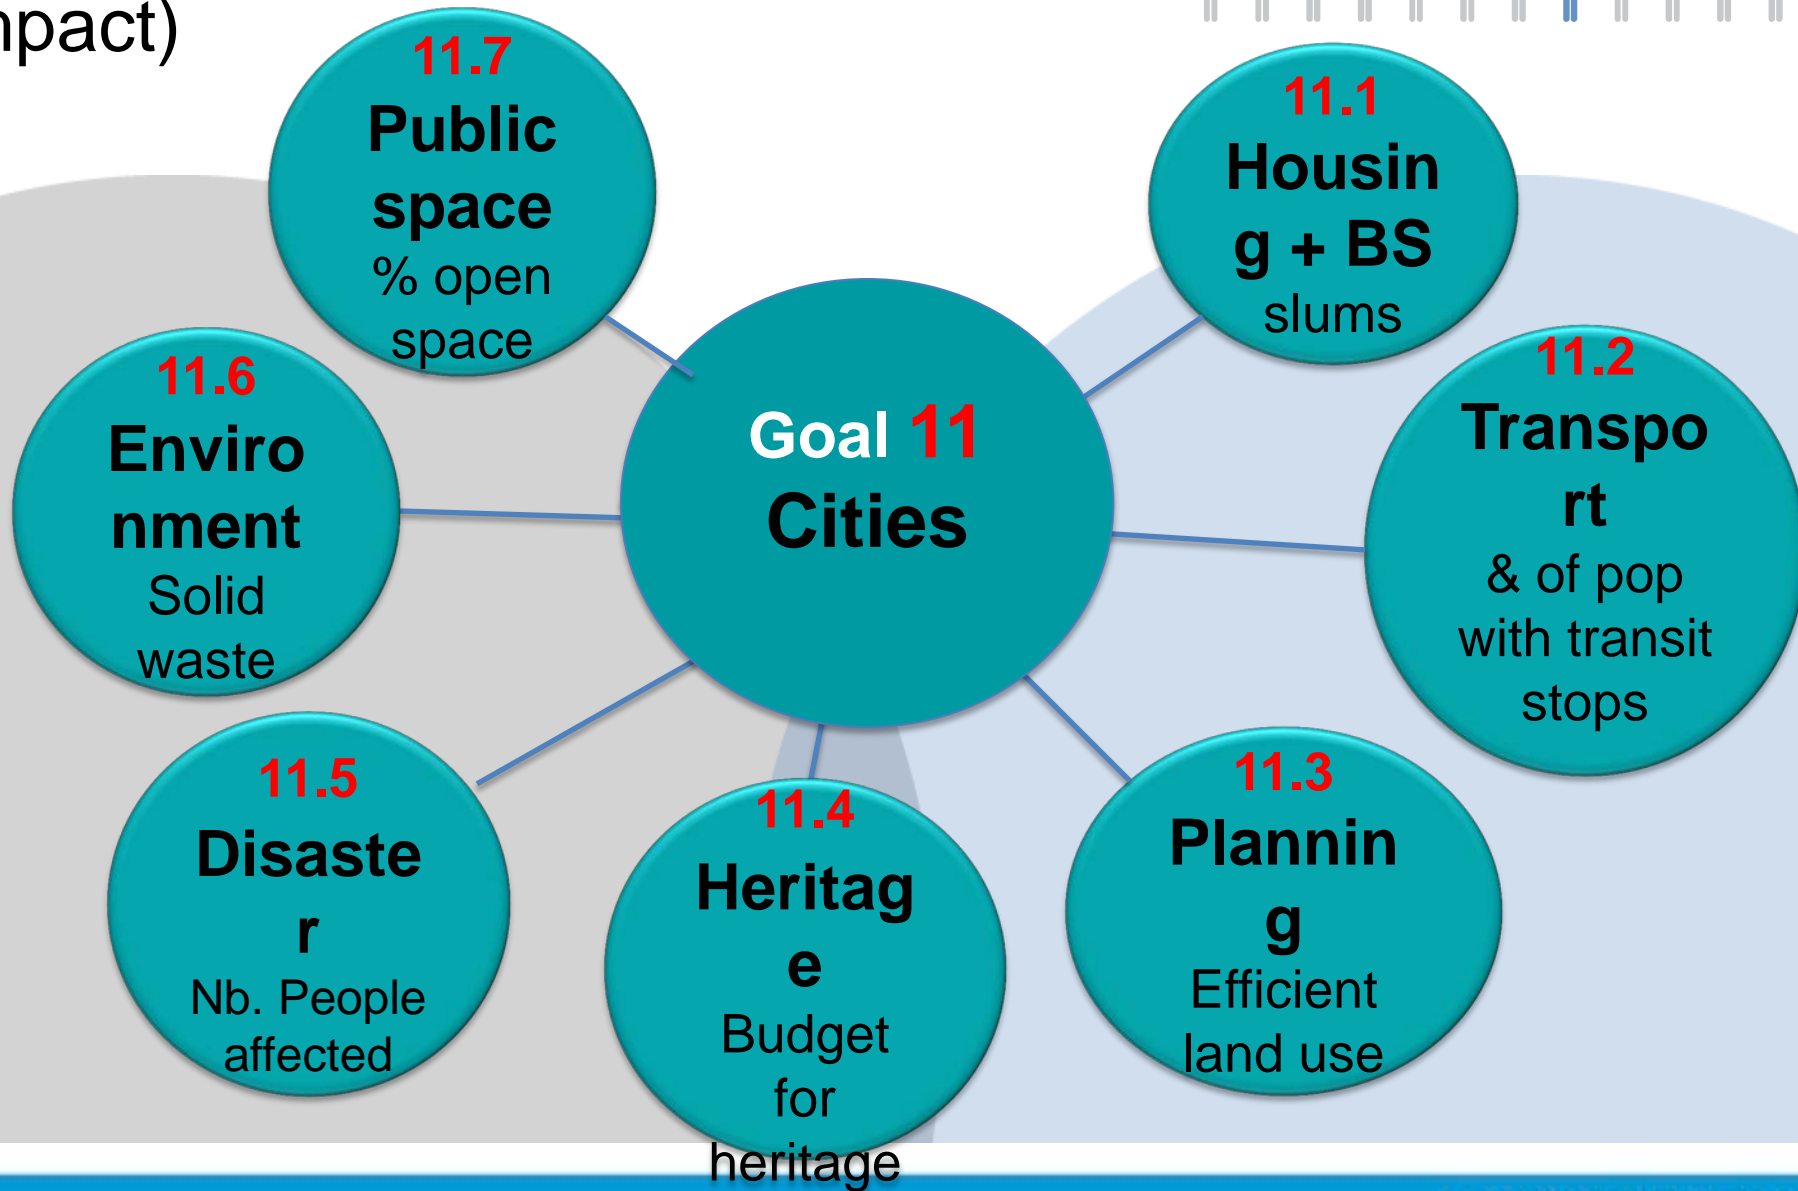

- Improve sampling
- Identifying vulnerable groups
- Segregate variables/indicators
- Rapid assessment
- Increase level of accuracy
- Land uses
- Allocate resources
- Vulnerability reduction and disaster preparedness
- Monitor changes overtime
- Simulation models

Warning, tracking, damage assessment

GOAL 11: INDICATORS CURRENTLY MONITORED

USE OF SPATIAL INDICATORS

Efficient land use (11.3)

Ratio of land consumption rate to population growth rate at comparable scale

Efficient land use (11.3)

	Population growth (thousands)				
City	1980	2000	2005	2010	% growth
Cancun	37	431	586	677	18.2

	Surface or Area growth (Ha)				
City	1980	2000	2005	2010	% expansion rate
Cancun	438	4,341	5,835	12,340	25.82

The sprawl index (SI) measures the growth in built-up area adjusted for the growth in city population
(years of reference)

Rate sprawl	1.81
Normalization	0.90

Street connectivity and the CPI

Indicator

Accessibility of Open Public Areas

Scope

Extended CPI

Rationale

This indicator provides information about the open public areas in a city has and whether this amount is sufficient for its population. Additionally, this indicator considers the accessibility of open public areas and the distribution of the total area across the city. In most countries, the concept of an open public area is related to green areas (where green areas are defined as public and private areas that have flora such as plants, trees and grass). Nevertheless, the two principal roles of an open public area are to provide a space for healthy social interaction space and improve air quality (WHO, 2012).

Individuals residing in towns and cities should have access to natural green spaces or open public spaces less than 300 meters from home (Natural England; see also The Wildlife Trust & Natural England, 2009; Harrison et al., 1995; Barker, 1997; Handley et al., 2003; Wray et al., 2005; [1])

A prosperous city has enough open public area for its residents, which is properly distributed and easy to access.

Definition

The percentage of the urban area located less than 300 meters away from an open public space.

Definition

An open area is concept is related to the definition of open public spaces (Sandelack & Alar, 2013), Sandelack & Alar [2], open public spaces include:

- Parks: open spaces inside a city and contact with nature. Their portion of green area.
- Civic parks: open spaces of open area, which was later transformed. They are characterised by commercial and cultural elements and interaction among people. They are usually public spaces that are used for recreational development, or cultural activities.
- Recreational green areas: public spaces for mental preservation. All recreational areas must be linked to urban areas and must be linked to urban areas and passive recreation.
- Facility public areas: open spaces that are part of city facilities (defined as public libraries, stadium, public buildings, etc.). The following characteristics: public spaces for both active and passive recreation.
